GENERAL INTRODUCTION

This chapter describes the data requirements for the aspect physical-chemical properties and how these are evaluated in the EU framework under Regulation (EC) No 1107/2009 [1]. The described risk assessment in this chapter can be used for both the approval procedure for active substances as well as for zonal applications for the authorization of plant protection products (i.e. core registration reports).

The chapter describes the procedures following the data requirements as laid down in Commission Regulation (EU) No 283/2013 for active substances and in Commission Regulation (EU) No 284/2013 for plant protection products. These data requirements apply for active substances submitted after 31 December 2013 and for plant protection products submitted after 31 December 2015.

A concept guidance is available on the interpretation of the transitional measures for the data requirements for chemical active substances according to Regulation (EU) No 283/2013 and Regulation (EU) No 284/2013 (SANCO/11509/2013 – rev. 0.1).

1. EU FRAMEWORK

In this document, the procedures for the evaluation and re-evaluation of active substances as laid down in the EU are described; the NL procedure for evaluation of a substance is reverted to when no EU procedure has been laid down. The NL-procedure for the evaluation of a substance is described in §2 - §2.5 of part 2 of the Evaluation Manual (plant protection products). This document aims to give procedures for the approval of active substances and inclusion in Commission Implementing Regulation (EU) No 540/2011 [3]

1.1. Introduction

Composition and physical-chemical properties are evaluated to prevent products being placed on the market which:

1. are of insufficient quality resulting in reduced applicability or reduced efficacy
2. may cause risks to user, public health and environment. This in particular concerns properties of the product that are relevant for the field of use and efficacy so that no undesirable effects occur during application of the product, such as precipitation of the product in the spray tank, excessive foam formation, blocking of spray nozzles by coarse particles or poor water-miscibility.

Properties of the formulation are also important from the point of view of safety and human health for which aspects such as flammability of the product and the presence of undesirable impurities are relevant.

The most important guidance documents for this chapter are:

1.2. Data requirements

Generally, EU and OECD guidelines for the protocol of experiments are mentioned in Commission Communications 2013/C 95/01 [7]

When the applicant holds the view that a certain study is not necessary, a relevant scientific justification can be provided for the non-submission of the particular study.

Where GLP is required, studies carried out after 25 July 1993 should be performed to GLP.

There may be no doubt about the identity of the tested product or the purity of the tested substance for each study.

The data requirements, and the fact whether or not they are required for specific fields of use and the corresponding guidelines are summarised in the overview table, see Appendix 1 and 2 to this chapter.

1.2.1. Data requirements for the active substance
The text below in grey frames has been taken from Commission Regulation (EU) No 283/2013. The numbering in these grey frames follows the section numbering in this Commission Regulation. Any necessary additions to the text have been added below the grey frames. Data requirements as stated in Commission Regulation (EU) No 283/2013 and Commission Regulation (EU) No 284/2013 are given below the headings.

The data requirements regarding the physical-chemical properties of the active substance are described in part A of Commission Regulation (EU) No 283/2013, points 1 (identity of the active substance), 2 (physical and chemical properties of the active substance), and 3 (further information on the active substance).

Identity of the active substance

1. Identity of the active substance

The information provided shall be sufficient to precisely identify each active substance and define it in terms of its specification and nature.

Applicant (name, address, etc.)
(283/2013; 1.1)

1.1. Applicant

The name and address of the applicant shall be provided, as well as the name, position, telephone, e-mail address and telefax number of a contact point
Producer (name, address, including location of plant) (283/2013; 1.2)

1.2. Producer

The name and address of the producer of the active substance shall be provided, as well as the name and address of each manufacturing plant in which the active substance is manufactured. A contact point (name, telephone, e-mail address and telefax number) shall be provided. Where following approval of the active substances, there are changes in the location or number of producers, the information required shall again be notified to the Commission, the Authority and the Member States.

If the active substance is to be obtained from a different manufacturer or when there is a change of location of the manufacturing plant of the active substance, this should be notified. For guidance on data requirements related to changes of the producer, refer to the guidance document on the assessment of the equivalence of technical materials, SANCO/10597/2003 [19].

Common name proposed or ISO-accepted, and synonyms (283/2013; 1.3)

1.3. Common name proposed or ISO-accepted, and synonyms

The International Organization for Standardization (ISO) common name, or proposed ISO common name and where relevant, other proposed or accepted common names (synonyms), including the name (title) of the nomenclature authority concerned, shall be provided.

Chemical name (IUPAC and CA nomenclature) (283/2013; 1.4)

1.4. Chemical name (IUPAC and CA nomenclature)

The chemical name as given in Part III of Annex VI to Regulation (EC) No 1272/2008, or, if not included in that Regulation, in accordance with both the International Union of Pure and Applied Chemistry (IUPAC) and Chemical Abstracts (CA) nomenclature, shall be provided, where applicable.

Producer’s development code numbers (283/2013; 1.5)

1.5. Producer’s development code numbers

Code numbers used to identify the active substance, and where available, formulations containing the active substance, during development work, shall be reported. For each code number reported, the material to which it relates, the period for which it was used, and the Member States or other countries in which it was used and is being used, shall be stated.

CAS, EC and CIPAC numbers (283/2013; 1.6)
1.6. CAS, EC and CIPAC numbers

Chemical Abstracts Service (CAS), European Commission (EC) and Collaborative International Pesticides Analytical Council (CIPAC) numbers, where they exist, shall be reported.

The CIPAC number of a substance can be obtained on the following website: http://www.cipac.org/.

Molecular and structural formula, molecular mass
(283/2013; 1.7)

1.7. Molecular and structural formula, molecular mass

The molecular formula, molecular mass and structural formula of the active substance, and where relevant, the structural formula of each isomer present in the active substance, shall be provided.

For plant extracts, a different approach may be taken if adequately justified.

Method of manufacture (synthesis pathway) of the active substance
(283/2013; 1.8)

1.8. Method of manufacture (synthesis pathway) of the active substance

The method of manufacture, in terms of the identity (name, CAS number, structural formula) and purity of the starting materials and whether they are commercially available, the chemical pathways involved, and the identity of impurities present in the final product, shall be provided, for each manufacturing plant. Detailed information shall be given as to the origin of those impurities. Each impurity shall be categorised as resulting from side reactions, impurities in the starting material, remaining reaction intermediates or starting materials. Their toxicological, ecotoxicological and environmental relevance shall be addressed. This information shall also include impurities that are not detected but that could theoretically be formed. Generally process engineering information is not required.

Where the required information is provided for a pilot plant production system, that information shall again be provided once industrial scale production methods and procedures have stabilised. Where available, industrial scale data shall be provided before approval under Regulation (EC) No 1107/2009. Where data on industrial scale production are not available, a justification shall be provided.

For guidance on data requirements related to changes of the producer, refer to the guidance document on the assessment of the equivalence of technical materials, SANCO/10597/2003 [19].

Specification of purity of the active substance in g/kg
1.9. Specification of purity of the active substance in g/kg

The minimum content in g/kg of pure active substance in the manufactured material used for production of plant protection products, shall be reported. A justification shall be provided for the minimum content proposed in the specification; this shall include a statistical analysis of the data on at least five representative batches, as referred to in point 1.11. Additional supporting data may be provided to further justify the technical specification.

Where the required information is provided for a pilot plant production system, that information shall again be provided once industrial scale production methods and procedures have stabilised. Where available, industrial scale data shall be provided before approval under Regulation (EC) No 1107/2009. Where data on industrial scale production are not available, a justification shall be provided.

If the active substance is manufactured as technical concentrate (TK), the minimum and maximum content of the pure active substance shall be given, along with its content in the theoretical dry weight material.

If the active substance is a mixture of isomers, the ratio or the ratio range of the content of isomers shall be provided. The relative biological activity of each isomer, both in terms of efficacy and toxicity, shall be reported.

For plant extracts, a different approach may be taken if adequately justified.

The specification should at least meet the specification laid down by the FAO [8]. The technical material (TC) is the solvent-free material, including residual impurities, not isolated during manufacture. A non-isolated active substance in a solvent, including possible additives, is considered a technical concentrate (TK) is obtained. This may, e.g., be because the active substance is not stable in pure form or for safety reasons. Specifications are based on the TC, which is also known as a dry weight specification. Because the highest (practically) possible purity is always aimed for, only a minimum concentration has been laid down instead of an upper limit. When the TC is not isolated, the relevant physical-chemical properties of the TK should be determined and not those of the TC. Specifications for a TK can be derived from the specifications of a TC; in that case an upper limit should still be specified (a concentration range). The conclusion of a discussion in EPCO 11 (2004) was: “if the TC is not transported, marketed and the TK is simply diluted to form the formulation, the data for the TC is not required. However, if the TC is also marketed, transported then data on both will be required. Or if the TK is dried down or converted to the TC then again the data will be required”. This concerns the flammability, explosive and oxidising properties of the active substance.

Identity and content of additives (such as stabilisers) and impurities

1.10. Identity and content of additives (such as stabilisers) and impurities

The minimum and maximum content in g/kg of each additive shall be provided.

The maximum content in g/kg of each further component other than additives shall also
be provided.

If the active substance is manufactured as technical concentrate (TK), the maximum content of each impurity shall be given, along with their content in the theoretical dry weight material.

Isomers that are not part of the ISO common name are considered as impurities.

Where the information provided does not fully identify a component (for example condensates), detailed information on the composition shall be provided for each such component.

Where the required information is provided for a pilot plant production system, that information shall again be provided once industrial scale production methods and procedures have stabilised. Where available, industrial scale data shall be provided before approval under Regulation (EC) No 1107/2009. Where data on industrial scale production are not available, a justification shall be provided.

For plant extracts, a different approach may be taken if adequately justified.

The ‘non-active isomers’ of the active substance should according to the guidelines also be considered as impurities.

A detailed composition of the active substance should be provided by submitting a specification that is used for production. All impurities exceeding 0.1% w/w (or 1 g/kg) should be specified and identified.

Additives
(283/2013; 1.10.1)

1.10.1. Additives

The trade name of components added to the active substance, prior to manufacture of the plant protection product, to preserve stability and facilitate ease of handling, hereinafter ‘additives’, shall also be provided. The following information shall, where relevant, be provided for such additives:

(a) chemical name according to IUPAC and CA nomenclature;

(b) ISO common name or proposed common name if available;

(c) CAS number, EC number;

(d) molecular and structural formula;

(e) molecular mass;

(f) minimum and maximum content in g/kg; and

(g) function (for example stabiliser).
Significant impurities
(283/2013; 1.10.2)

1.10.2. Significant impurities

Impurities present in quantities of 1 g/kg or more shall be considered as significant. For significant impurities the following information, where relevant, shall be provided:

(a) chemical name in accordance to IUPAC and CA nomenclature;

(b) ISO common name or proposed common name, if available;

(c) CAS number, EC number;

(d) molecular and structural formula;

(e) molecular mass; and

(f) maximum content in g/kg.

Information on how the structural identity of the impurities was determined shall be given.

The specification should always meet the FAO specification. Where relevant impurities are present, these should be included in the specification with a realistic maximum. The specification should be a statistically based realistic reflection of the concentrations found in practice (mean value found in the batch analysis+ three times standard deviation) and should be representative for the batches used for toxicological and ecotoxicological testing. According to the FAO/WHO manual [4] the content of impurities must be given in g/kg in comparison with the active substance content. The absolute as well as the relative presentation of the specification are accepted.

Relevant impurities
(283/2013; 1.10.3)

1.10.3. Relevant impurities

Impurities that are particularly undesirable because of their toxicological, ecotoxicological or environmental properties, shall be considered as relevant. For relevant impurities the following information, where relevant, shall be provided:

(a) chemical name according to IUPAC and CA nomenclature;

(b) ISO common name or proposed common name if available,;

(c) CAS number, EC number;

(d) molecular and structural formula,;

(e) molecular mass; and

(f) maximum content in g/kg.
Information on how the structural identity of the impurities was determined shall be reported.

Relevant impurities may, e.g., be formed during the production process or by degradation of the active substance, but can also be process solvents or additives. Examples of relevant impurities are hexachlorobenzene in chlorothalonil, ETU (ethylene thiourea) in dithiocarbamates, but also impurities that are not directly related to the active substance such as dioxins and nitrosamines. Where on the basis of the production process relevant impurities can be expected, analysis of the active substance for these impurities may be requested. The applicant should indicate whether relevant impurities are present in the active substance; if this is the case, these should be included in the specification, even if below the cut-off criterion of 1g/kg.

*Analytical profile of batches*  
(*283/2013; 1.11*)

**1.11. Analytical profile of batches**

At least five representative batches from recent and current industrial scale production of the active substance shall be analysed for content of pure active substance, impurities, additives and each further component other than additives, as appropriate. All of the representative batches shall be within the last five years of manufacture. Where data from the last five years of production are not available, a justification shall be provided. The analytical results reported shall include quantitative data, in terms of g/kg content, for all components present in quantities of 1 g/kg or more and typically should account for at least 980 g/kg of the material analysed. For plant extracts and semiochemicals (such as pheromones), justified exemptions can be made. The statistical basis for the content proposed in the technical specification shall be explained (for example: maximum level found in practice, average plus three standard deviations of levels found in practice, etc.). Supporting data may be provided to further justify the technical specification. The actual content of components which are particularly undesirable because of their toxicological, ecotoxicological or environmental properties shall be determined and reported even if present in quantities below 1 g/kg. Data reported shall include the results of the analysis of individual samples and a summary of that data, to show the minimum, maximum and mean content of each relevant component.

Where an active substance is produced in different plants this information shall be provided for each of the plants separately.

In addition, where relevant, samples of the active substance produced at laboratory scale or pilot production systems, shall be analysed, if such material was used in generating toxicological or ecotoxicological data. If this data is not available a justification shall be provided.

At least 5 representative batches should be analysed. These batches should be representative of the current production. The impurities content of the batches should meet the specification of the active substance as provided by the manufacturer and the FAO specification where available. The used analytical methods must meet the requirements laid down in Chapter 3 ‘Analytical methods’.

In addition to batch analysis data, quality control (QC) data can be used to support a
proposed technical specification. The EFSA working document for PRAPeR meetings on section 1 mentions the following:

If quality control data are to be relied on in support of a technical specification what are the minimum requirements for the submission of this data.
- Only a summary of the data is required, not the raw data, although this should be available on request. For the active substance and the impurities the mean, minimum, maximum values and standard deviation should be provided for each production year as well as for the total batch data submitted.
- The number of batches analysed, the year of their production and the total number of batches produced in the respective years should be provided.
- The site of manufacture (source) must be identified.

**Physical and chemical properties of active substance**

**FAO specifications** can be obtained via the internet. In addition, **OECD** test methods are available. A large number of test methods (EEC methods A1 - A21) are available on the internet as well [9].

**Melting point and boiling point**

(283/2013; 2.1)

2.1. Melting point and boiling point

The melting point or where appropriate the freezing or solidification point of purified active substance shall be determined and reported. Measurements shall be taken up to 360 °C.

The boiling point of purified active substance shall be determined and reported. Measurements shall be taken up to 360 °C.

Where melting point or boiling point cannot be determined because of decomposition or sublimation, the temperature at which decomposition or sublimation occurs shall be reported.

There are no clear European agreements about the minimum temperature down to which the freezing point should be determined. Testing down to -20°C is generally considered to be adequate.

**Vapour pressure, volatility**

(283/2013 ; 2.2)

2.2. Vapour pressure, volatility

The vapour pressure of purified active substance at 20 or 25 °C shall be reported. Where vapour pressure is less than 10⁻⁵ Pa at 20 °C the vapour pressure at 20 or 25 °C shall be estimated by a vapour pressure curve With measurements at higher temperatures.

In the case of active substances which are solids or liquids, volatility (Henry’s law constant) of purified active substance shall be determined or calculated from its water solubility and vapour pressure and be reported (in Pa × m³ × mol⁻¹).
**Appearance (physical state, colour)**
*(283/2013; 2.3)*

2.3. **Appearance (physical state, colour and odour; if known)**

A description of both the colour, if any, and the physical state of both the active substance as manufactured and purified active substance, shall be provided.

**Spectra (UV/VIS, IR, NMR, MS), molecular extinction at relevant wavelengths, optical purity**
*(283/2013; 2.4)*

2.4. **Spectra (UV/VIS, IR, NMR, MS), molecular extinction at relevant wavelengths, optical purity**

The following spectra, including a table of signal characteristics needed for interpretation, shall be determined and reported: Ultraviolet/Visible (UV/VIS), infrared (IR), nuclear magnetic resonance (NMR) and mass spectra (MS) of purified active substance.

Molecular extinction at relevant wavelengths shall be determined and reported ($\varepsilon$ in $\text{L} \times \text{mol}^{-1} \times \text{cm}^{-1}$). Relevant wavelengths include all maxima in the UV/visible absorption spectrum, as well as the wavelength range of 290-700 nm.

In the case of active substances which are resolved optical isomers, the optical purity shall be determined and reported.

Where necessary for the identification of the impurities considered to be of toxicological, ecotoxicological or environmental significance, the UV/visible absorption spectra, IR, NMR and MS spectra, shall be determined and reported.

The spectra should be suitable for identification purposes.

**Solubility in water**
*(283/2013; 2.5)*

2.5. **Solubility in water**

The water solubility of purified active substances under atmospheric pressure shall be determined and a value reported for 20 °C. These water solubility determinations shall be made in the neutral range (that is to say in distilled water in equilibrium with atmospheric carbon dioxide). If the pKa is between 2 and 12, water solubility shall also be determined in the acidic range (pH 4 to 5) and in the alkaline range (pH 9 to 10). Where the stability of the active substance in aqueous media is such that water solubility cannot be determined, a justification based on test data shall be provided.

**Solubility in organic solvents**
*(283/2013; 2.6)*

2.6. **Solubility in organic solvents**

The solubility of the active substances as manufactured or purified active substance in the
following organic solvents at 15 to 25 °C shall be determined and reported if less than 250 g/L; the temperature applied shall be specified. Results shall be reported as g/L.

(a) Aliphatic hydrocarbon: preferably heptane
(b) Aromatic hydrocarbon: preferably toluene
(c) Halogenated hydrocarbon: preferably dichloromethane,
(d) Alcohol: preferably methanol or isopropyl alcohol
(e) Ketone: preferably acetone
(f) Ester: preferably ethyl acetate.

If for a particular active substance, one or more of these solvents is unsuitable (for example reacts with test material), alternative solvents may be used instead. In such cases, choices of solvents shall be justified in terms of their structure and polarity.

CIPAC method MT 181 ‘solubility in organic solvents’ can be used where solubility exceeds 10 g/L. CIPAC method MT 157 (water solubility) can be amended and used for lower concentrations.

CIPAC methods can be used without validation. CIPAC methods can be obtained via http://www.cipac.org/.

Partition coefficient n-octanol/water
(283/2013; 2.7)

2.7 Partition coefficient n-octanol/water

The n-octanol/water partition coefficient (Kow or log Pow) of purified active substance and of all components of the residue definition for risk assessment shall be determined and reported for 20 °C or 25 °C. The effect of pH (4 to 10) shall be investigated when the active substance has a pKa value between 2 and 12.

According to the description the EC method (or in fact: the HPLC method as well as shake-flask method as described in EC method A8) cannot be used for surface active compounds (surface tension < 60mN/m tested at the appropriate concentration and temperature). During the EPCO 11 meeting (2004) the following was decided as regards the suitability of the method in case of a surface active compound: "It was thought that the shake-flask method could be used as long as there are no other problems encountered, e.g. phase separation.

The column elution method cannot be used for surface active compounds". For surface active compounds the report on the determination of the octanol/water partition coefficient should contain information about a possible phase separation to enable evaluation.

Dissociation in water
(283/2013; 2.8)
2.8. Dissociation in water
Where dissociation in water occurs, the dissociation constants (pKa values) of the purified active substance shall be determined and reported for 20 °C. The identity of the dissociated species formed, based on theoretical considerations, shall be reported. If the active substance is a salt the pKa value of the non-dissociated form of the active substance shall be given.

Flammability and self-heating
(283/2013; 2.9)

2.9. Flammability and self-heating
The flammability and self-heating of active substances as manufactured shall be determined and reported. A theoretical estimation based on structure shall be accepted if it meets the criteria set out in Appendix 6 of the United Nations’ Recommendations on the Transport of Dangerous Goods Manual of Tests and Criteria (1). In justified cases, data for purified active substance may be used.

Flash point
(283/2013; 2.10)

2.10. Flash point
The flash point of active substances as manufactured with a melting point below 40 °C shall be determined and reported. In justified cases, data for purified active substance may be used.

Explosive properties
(283/2013; 2.11)

2.11. Explosive properties
The explosive properties of active substances as manufactured shall be determined and reported. A theoretical estimation based on structure shall be accepted if it meets the criteria set out in Appendix 6 of the United Nations ‘Recommendations on the Transport of Dangerous Goods, Manual of Tests and Criteria’. In justified cases, data for purified active substance may be used.

In the case a theoretical estimation is insufficient, the requirements for explosive properties as laid down in Regulation (EC) 1272/2008 shall be followed.

Surface tension
(283/2013; 2.12)

2.12. Surface tension
The surface tension of purified active substance shall be determined and reported.

This concerns active substances such as these are produced.
Oxidising properties
(283/2013; 2.13)

2.13 Oxidising properties

The oxidising properties of active substances as manufactured, shall be determined and reported. A theoretical estimation based on structure shall be accepted if it meets the criteria set out in Appendix 6 of the United Nations ‘Recommendations on the Transport of Dangerous Goods Manual of Tests and Criteria’. In justified cases data for purified active substance may be used.

In the case a theoretical estimation is insufficient, the requirements for oxidising properties as laid down in Regulation (EC) 1272/2008 shall be followed.

Further information on the active substance

Data referred to under (i) and the corresponding requirements 3.1 - 3.6 are discussed under the aspect efficacy, see Chapter 8, Efficacy (Plant Protection Products).

Information on the occurrence or possible occurrence of the development of resistance and appropriate management strategies
(293/2013; 3.7)

3.7. Information on the occurrence or possible occurrence of the development of resistance and appropriate management strategies

Where available, information on the occurrence or possible occurrence of the development of resistance or cross- resistance shall be provided.

Appropriate risk management strategies shall be addressed for national/regional areas.

Methods and precautions concerning handling, storage, transport or fire
(293/2013; 3.8)

3.8. Methods and precautions concerning handling, storage, transport or fire

A safety data sheet pursuant to Article 31 of Regulation (EC) No 1907/2006 of the European Parliament and of the Council (') shall be provided for all active substances.

The studies, data and information submitted, together with other relevant studies, data and information, shall both specify and justify the methods and precautions to be followed in the event of fire. The possible products of combustion in the event of fire shall be estimated, based on the chemical structure and the chemical and physical properties of the active substance.

Safety data sheets must be prepared according to Regulation (EC) No 1907/2006.

Procedures for destruction or decontamination
(283/2013; 3.9)

3.9. Procedures for destruction or decontamination
3.8.1. Controlled incineration
In many cases the preferred or sole means to safely dispose of active substances, contaminated materials, or contaminated packaging, is through controlled incineration in a licensed incinerator. Such incineration shall be carried out in accordance with the criteria set out in Council Directive 94/67/EC (1).

Other methods to dispose of the active substance, contaminated packaging and contaminated materials, where proposed, shall be fully described. Data shall be provided for such methods, to establish their effectiveness and safety.

Emergency measures in case of an accident
(283/2013; 3.10)

3.10. Emergency measures in case of an accident
Procedures for the decontamination of water in case of an accident shall be provided.

The studies, data and information submitted, together with other relevant studies, data and information, shall demonstrate the suitability of measures proposed for use in emergency situations.

1.2.2. Data requirements for the plant protection product
The text below in grey frames has been taken from Commission Regulation (EU) No 284/2013. The numbering in these grey frames follows the section numbering in this Commission Regulation. Any necessary additions to the text have been added below the grey frames. Question numbers (NL as well as EU) are given below the headings.

Generally, EU and OECD guidelines for the protocol of experiments are mentioned in Commission Communications 2013/C 95/02 [10]

The data requirements regarding the physical-chemical properties of the plant protection product are described in part A of Commission Regulation (EU) No 284/2013, points 1 (identity of the plant protection product), 2 (physical-chemical and technical properties of the plant protection product), and 4 (further information on the plant protection product).

Identity of the plant protection product

1. Identity of the plant protection product
The information provided shall be sufficient to precisely identify the plant protection product and define it in terms of their specification and nature.

Applicant (name and address, etc.)
(284/2013; 1.1)

1.1. Applicant
The name and address of the applicant shall be provided, as well as the name, position, telephone, e-mail address and telefax number of the contact point.
Producer of the plant protection product and of the active substances (names and addresses etc. including location of plants) (284/2013; 1.2)

1.2. Producer of the plant protection product and of the active substances

The name and address of the producer of the plant protection product and of each active substance in the plant protection product shall be provided, as well as the name and address of each manufacturing plant in which the plant protection product and active substance are manufactured. A contact point (name, telephone, e-mail address and telefax number) shall be provided.

If the active substance originates from a manufacturer from which data in accordance with Regulation (EU) 284/2013 have not been submitted previously, data to address those requirements shall be provided in order to establish equivalence of the active substance.

Trade name or proposed trade name and producer's development code number of the plant protection product if appropriate (284/2013; 1.3)

1.3. Trade name or proposed trade name and producer's development code number of the plant protection product if appropriate

All former and current trade names and proposed trade names and development code numbers of the plant protection product shall be provided. Where trade names and code numbers referred to, relate to similar but different plant protection product, full details of the differences shall be provided. The proposed trade shall be such that it does not give rise to confusion with the trade name of already authorised plant protection products. Each code number shall be specific to a unique plant protection product.

Detailed quantitative and qualitative information on the composition of the plant protection product (284/2013; 1.4.1, 284/2013; 1.4.2, 284/2013; 1.4.3)

1.4. Detailed quantitative and qualitative information on the composition of the plant protection product

1.4.1. Composition of the plant protection product

For plant protection products the following information must be reported:

- the content of the technical active substances (based on the specified minimum purity) and the declared content of pure active substances and, where relevant, the corresponding content of the variant (such as salts and esters) of the active substances,

- the content of safeners, synergists and co-formulants,

- the maximum content of relevant impurities, where appropriate.

In addition to the total active substance content, for slow or controlled release plant protection products (such as capsule suspension, CS) the free (non-encapsulated) and encapsulated active substance content and the release rate shall be given. Where
possible, appropriate Collaborative International Pesticides Analytical Council (CIPAC) methods shall be used. If an alternative method is used this shall be justified by the applicant and a detailed description of the methodology used shall be given.

The concentration of each active substance shall be expressed as follows:

— for solids, aerosols, volatile liquids (maximum boiling point 50 °C) or viscous liquids (lower limit 1 Pa s at 20 °C), as % w/w and g/kg,
— for other liquids/gel formulations, as % w/w and g/l,
— for gases, as % v/v and % w/w.

1.4.2. Information on the active substances

For active substances their International Organisation for Standardisation (ISO) common names or proposed ISO common names, their CIPAC numbers, and, where available, the European Commission (EC) numbers shall be provided. Where relevant it shall be stated which salt, ester, anion or cation is present.

1.4.3. Information on the safeners, synergists and co-formulants

Safeners, synergists and co-formulants shall, where possible, be identified both by their chemical name as given in Part 3 of Annex VI to Regulation (EC) No 1272/2008 of the European Parliament and of the Council or, if not included in that Regulation, in accordance with both the International Union of Pure and Applied Chemistry (IUPAC) and Chemical Abstracts (CA) nomenclature. Their structural formula shall be provided. For each component of the safeners, synergists and co-formulants the relevant EC number and Chemical Abstracts Service (CAS) number, where they exist, shall be provided. For co-formulants which are mixtures, the composition shall be provided. Where the information provided does not fully identify the safener, synergist or co-formulant, an appropriate specification shall be provided. The trade name, where available, shall also be provided. Safety data sheets pursuant to Article 31 of Regulation (EC) No 1907/2006 (*) shall be provided. They shall be up to date and in accordance with other Union legislation.

For co-formulants the function shall be specified from among the following:

(a) adhesive (sticker);
(b) antifoaming agent;
(c) antifreeze;
(d) binder;
(e) buffer;
(f) carrier;
(g) deodorant;
(h) dispersing agent;
(i) dye;
(j) emetic;
(k) emulsifier;
(l) fertiliser;
(m) preservative;
(n) odourant;
(o) perfume;
(p) propellant;
(q) repellent;
(r) solvent;
(s) stabiliser;
(t) thickener;
(u) wetting agent;
(v) miscellaneous (shall be specified by the applicant).

A description of the formulation process shall be provided.

If the product contains a total of more than 10% ‘aliphatic, alicyclic and aromatic hydrocarbons’ the risk phrase R65 (1999/45/EC) or hazard statement H304 (1272/2008/EC) should be assigned, depending on viscosity and/or surface tension of the product. The term ‘aliphatic, alicyclic and aromatic hydrocarbons’ refers to solvents that consist only of carbon and hydrogen atoms.

The active substance is only included in the summation if it falls under this definition (e.g. mineral oils).

At European level there is no agreement when a safety data sheet is up to date. For safety data sheet evaluation the Netherlands uses the criteria as described in §2.2.2, NL part.
1.5. Type and code of the plant protection product

The type and code of plant protection product shall be designated according to the latest edition of the ‘Manual on development and use of FAO and WHO specifications for pesticides’ prepared by the FAO/WHO Joint Meeting on Pesticide Specifications (JMPS).

Where a plant protection product is not defined precisely in this publication, a full description of the physical nature and state of the plant protection product shall be provided, together with a proposal for a suitable description of the type of plant protection product and a proposal for its definition.

See also FAO/WHO manual (which replaced the GIFAP monograph) or Appendix 3 for type and code.

1.6. Function

The function shall be specified from among the following:

- acaricide,
- bactericide,
- fungicide,
- herbicide
- insecticide,
- molluscicide,
- nematicide,
- plant growth regulator,
- repellant,
- rodenticide,
- semio-chemicals,
- talpicide,
- viricide,
- other (shall be specified by the applicant).
Physical, chemical and technical properties of the plant protection product
(284/2013; 2)

The extent to which plant protection products for which authorisation is sought, comply with relevant FAO/WHO specifications, shall be stated. Divergences from these specifications shall be described in detail, and justified by the applicant.

Appearance
(284/2013; 2.1)

A description of both the colour and of the physical state of the preparation shall be provided.

Explosive and oxidizing properties
(284/2013; 2.2)

The explosive and oxidising properties of plant protection products shall be determined and reported. A theoretical estimation based on structure shall be accepted if it meets the criteria set out in Appendix 6 of the United Nations’ Recommendations on the Transport of Dangerous Goods Manual of Tests and Criteria (\(^1\)).

Method A21 is available for determination of the oxidising properties of liquid formulations, which can also be found in Regulation (EC) No. 440/2008.

Extrapolation of the test methods EC A14, EC A17 and EC A21 to the UN tests, as prescribed by Regulation (EC) 1272/2008 is not possible. It is advisable to use the screening procedures as much as possible.

Flammability and self-heating
(284/2013; 2.3)

The flash point of liquids which contain flammable solvents shall be determined and reported. The flammability of solid plant protection products and gases shall be determined and reported. A theoretical estimation based on structure shall be accepted if it meets the criteria set out in Appendix 6 of the United Nations’ Recommendations on the Transport of Dangerous Goods Manual of Tests and Criteria.

The self-heating shall be determined and reported.

Extrapolation of the test methods EC A10, EC A15 and EC A16 to the UN tests, as prescribed by Regulation (EC) 1272/2008, is not possible. It is advisable to use the screening procedures as much as possible.
Acidity/alkalinity and pH value
(284/2013; 2.4.)

2.4. Acidity/alkalinity and pH value

In the case of aqueous plant protection products, the pH value of the neat plant protection product shall be determined and reported.

In the case of solid and non-aqueous liquid plant protection products which are to be applied as aqueous dilutions the pH of a 1% dilution of the plant protection product shall be determined and reported.

In the case of plant protection products which are acidic (pH < 4) or alkaline (pH > 10) the acidity or alkalinity shall be determined and reported.

The pH of the undiluted preparation should always be determined for an aqueous preparation.

CIPAC MT 75.3 is a revised method for determination of the pH.

The acidity (pH<4) or alkalinity (pH>10) is to be determined using CIPAC method MT 191 or a comparable method.

Viscosity and surface tension
(284/2013; 2.5)

2.5. Viscosity and surface tension

For liquid formulations the viscosity shall be determined at two shear rates and at 20°C and 40°C and reported together with the test conditions. The surface tension shall be determined at the highest concentration.

For liquid plant protection products containing ≥10 % hydrocarbons and for which the kinematic viscosity is less than 7 x 10 – 6 m²/sec at 40°C the surface tension of the neat formulation shall be determined at 25°C and reported.

Only the rotational viscometer can be used for determination of the (dynamic) viscosity of non-newtonian liquids. CIPAC method MT 192, based op OECD114, is the preferred method. CIPAC MT192 requires two shear rates to be reported, covering the range of 20 to 100s⁻¹.

In case the viscosity is required for classification and labelling (assignment risk phrase R65 or H304), viscosity shall be determined at 40°C.

Relative density and bulk density
(284/2013; 2.6)

2.6. Relative density and bulk density

The relative density of liquid plant protection products shall be determined and reported.
The bulk density (pour and tap) of plant protection products which are powders or granules shall be determined and reported.

*Storage stability and shelf-life: effects of temperature on technical characteristics of the plant protection product*  
(284/2013; 2.7)

2.7. Storage stability and shelf-life: effects of temperature on technical characteristics of the plant protection product

The stability of the plant protection product after accelerated storage for 14 days at 54 °C shall be determined and reported. Data generated from alternative time/temperature combinations (for example 8 weeks at 40 °C, 12 weeks at 35 °C or 18 weeks at 30 °C) may be submitted as alternative accelerated storage data. Consideration shall be given to performing this test in packaging made of the same material as the commercial packaging.

If the active substance content after the heat stability test has decreased by more than 5% from the initial value, then information on the breakdown products shall be supplied.

For liquid plant protection products, the effect of low temperatures on stability shall be determined and reported.

The shelf life of the plant protection product at ambient temperature shall be determined and reported. Where shelf life is less than two years, the shelf life in months, with appropriate temperature specifications, shall be reported. The ambient temperature stability test shall be performed in packaging made of the same material as the commercial packaging. Where appropriate, data on the content of relevant impurities, before and after storage, shall be provided.

MT 46.3 is a new revised method for the accelerated storage test. GIFAP monograph 17 can be obtained from Croplife International [11]. The revised monograph no. 17 refers to the WHO/FAO pesticide specification manual for information on which properties are to be determined before and after storage [4]

If the product shows a decrease of more than 10% of the active substance, it may be necessary to state the shelf-life of the product on the label (e.g. in months). This depends on the actual decrease, the fact whether or not the specifications are met after the decrease, and the efficacy of the product after storage.

For aerosols it should be demonstrated that the nozzle is not blocked after storage. No corrosion of the nozzle may be visible after storage. The aerosol must sometimes be opened for determination of the properties of its content. This can, e.g., be done according to the method described in the FAO/WHO manual under 8.11 (aerosol dispensers). More methods for determination of the physical properties of an aerosol can be obtained from the ‘European Aerosol Federation’ [12] in Belgium.

Besides the stability of the active substance, the physical stability of the product must also
be studied in the storage tests.

The test method used, including test conditions where necessary, and if applicable the analytical method, should in any case be given for each result. See Appendix 4 for the details of the tests to be carried out.

It should also be checked in the storage tests whether the trade pack is suitable for its content (e.g. by checking for: corrosion, leakage, malformation, closure). This means that the test must be carried out with the trade pack or a pack of comparable material. Where different packaging materials are used, these should all be investigated and described in the test, insofar as these show essential mutual differences (to be indicated by the applicant).

Technical characteristics of the plant protection product
(284/2013; 2.8)

2.8. Technical characteristics of the plant protection product

The technical characteristics of the preparation shall be determined and reported at appropriate concentrations.

The requirements for determination of the technical characteristics of the plant protection product are formulation type specific. Appendix 4 lists the specific requirements for frequently used formulation types.

FAO specifications are not yet available for new formulation types. In such cases, the criteria are derived from known formulation types, giving an explication of the choices that have been made.
CIPAC standard water
The hardness of the water used in the test is relevant for a number of properties. Water types A and C were recommended in the previous FAO guideline, revision 4, but as from FAO guideline, revision 5, water type D is recommended as standard (‘hard’) water, even if the CIPAC methods recommend a different water type. Standard water A and D must be used for the emulsion and dispersion tests because the properties may be affected by soft as well as by hard water. The type of water used must be clearly indicated for all tests.

Wettability
(284/2013; 2.8.1)

2.8.1. Wettability
The wettability of solid preparations, which are diluted for use shall be determined and reported.

Persistent foaming
(284/2013; 2.8.2)

2.8.2. Persistent foaming
The persistence of foaming of plant protection products to be diluted with water, shall be determined and reported.

Suspensibility, spontaneity of dispersion and dispersion stability
(545/2011; 2.8.3)

2.8.3. Suspensibility, spontaneity of dispersion and dispersion stability
The suspensibility and the spontaneity of dispersion of water dispersible products shall be determined and reported.

The dispersion stability of plant protection products such as aqueous suspo-emulsions (SE), oil-based suspension concentrates (OD) or emulsifiable granules (EG) shall be determined and reported.

The new CIPAC method MT 184 is a harmonised method of MT 15, 161 and 168 suitable for all formulations and is preferred over the old methods. A test for tablets is not yet available.

Degree of dissolution and dilution stability
(284/2013; 2.8.4)

2.8.4. Degree of dissolution and dilution stability
The degree of dissolution and the dilution stability of water soluble products shall be determined and reported.

CIPAC method MT 41 is suitable for liquid formulations such as SL and LS. CIPAC method MT 179 is suitable for solid formulations such as SS, ST, SG and SP.
Particle size distribution, dust content, attrition and mechanical stability
(284/2013; 2.8.5)

Particle size distribution
(284/2013; 2.8.5.1)

2.8.5. Particle size distribution, dust content, attrition and mechanical stability

2.8.5.1. Particle size distribution

In the case of water dispersible products, a wet sieve test shall be conducted and reported.

The size distribution of particles in the case of powders and suspension concentrates shall be determined and reported.

The nominal size range of granules shall be determined and reported.

Dust content
(284/2013; 2.8.5.2)

2.8.5.2. Dust content

The dust content of granular plant protection products shall be determined and reported.

If results show > 1 % w/w dust then the particle size of the dust generated shall be determined and reported.

Attrition
(284/2013; 2.8.5.3)

2.8.5.3. Attrition

The attrition characteristics of granules and tablets which are loose packed shall be determined and reported.

Hardness and integrity
(284/2013; 2.8.5.4)

2.8.5.4. Hardness and integrity

The hardness and integrity of tablets shall be determined and reported.

For powders method CIPAC MT 187 can also be used.
CIPAC methods MT 178 (for granules in general) and MT 178.2 (for water dispersible granules) can be used to determine attrition and friability characteristics of granules.
CIPAC method MT 193 must be used for tablets.

Emulsifiability, re-emulsifiability, emulsion stability
(284/2103; 2.8.6)

2.8.6. Emulsifiability, Re-emulsifiability, emulsion stability
The emulsifiability, emulsion stability and re-emulsifiability of plant protection products, which exist as emulsions in the spray tank, shall be determined and reported.

CIPAC method MT 183 is also suitable for emulsifiability, emulsion stability and re-emulsifiability of preparations that form emulsions. CIPAC method MT 180 has been developed for evaluation of the dispersibility of susp-emulsions.

Flowability, pourability and dustability
(284/2013; 2.8.7)

2.8.7. Flowability, pourability and dustability

The following characteristics shall be determined and reported:
— the flowability of granular plant protection products,
— the pourability of suspensions, and
— the dustability of dustable powders following accelerated storage according to point 2.7.

Physical and chemical compatibility with other products including plant protection products with which its use is to be authorised
(284/2013; 2.9)

2.9. Physical and chemical compatibility with other products including plant protection products with which its use is to be authorized

The physical and chemical compatibility of recommended tank mixes shall be determined and reported. Known non-compatibility shall be reported.

The method according to which the physical and chemical compatibility must be determined has not been laid down at EU level. Any European evaluation by the Netherlands will be carried out according to §2.2.2 of the NL part of the evaluation manual.

Adherence and distribution to seeds
(284/2013; 2.10)

2.10. Adherence and distribution to seeds

In the case of plant protection products for seed treatment, both distribution and adhesion shall be determined and reported.

CIPAC method MT 83 can be used for adhesion of powder formulations to seeds.

Other studies
(284/2013; 2.11)

2.11. Other studies

Supplementary studies necessary for the classification of the plant protection product by
Further information on the plant protection product
(284/2013; 4)

Safety intervals and other precautions to protect humans, animals and the environment
(284/2031; 4.1)

4.1. Safety intervals and other precautions to protect humans, animals and the environment

This part is described under the aspect efficacy, see Chapter 8, efficacy (crop protection) of the HTB.

Recommended methods and precautions
(545/2011 4.2)

4.2. Recommended methods and precautions

The recommended methods and precautions concerning washing/cleaning of machinery and protective equipment, detailed handling procedures for the storage, at both warehouse and user level of plant protection products, for their transport and in the event of fire shall be provided by the applicant. The effectiveness of cleaning procedures shall be described in detail. Where available, information on combustion products shall be provided. The risks likely to arise and the methods and procedures to minimise the hazards arising, shall be specified. Procedures to preclude or minimise the generation of waste or leftovers shall be provided.

Where appropriate, the nature and characteristics of protective clothing and equipment proposed shall be provided. The data provided shall be sufficient to evaluate the suitability and effectiveness under realistic conditions of use (for example field or glasshouse circumstances).

Emergency measure is the case of an accident
(284/2103; 4.3)

4.3. Emergency measures in the case of an accident

Detailed procedures to be followed in the event of an emergency, whether arising during transport, storage or use, shall be provided and include:
(a) containment of spillages;
(b) decontamination of areas, vehicles and buildings;
(c) disposal of damaged packaging, absorbents and other materials;
(d) protection of emergency workers and residents, including bystanders;
(e) first aid measures.

Packaging, compatibility of the plant protection product with proposed packaging materials
(284/2013; 4.4)
### 4.4. Packaging, compatibility of the plant protection product with proposed packaging materials

Packaging to be used shall be fully described and specified in terms of the materials used, manner of construction (for example extruded, welded), size and capacity, wall thickness, size of opening, type of closure and seals. Packaging shall be designed in order to limit as much as possible exposure of operators and of the environment.

All packaging used shall comply with the relevant Union legislation on transportation and safe handling.

Packaging must be described with at least the following data:
- material of the pack (inner and outer)
- material of an additional barrier, if any
- details of the closure
- diameter of the opening
- minimum and maximum size of the pack
- minimal thickness of the pack
- whether the packaging is intended for re-use
- outer pack, if applicable
- other details, if applicable

In case a product is applied by professional and non-professional users, it is required to indicate which pack sizes are intended for which type of user. Packaging sizes for non-professional users are limited to a maximum content for treatment of a 500m² area.

Packaging of a pesticide and its closure must meet the following requirements:
- they must be designed and manufactured in such a way that nothing of the content can escape
- the material of the packaging and of the closure must be of such composition that it cannot be attacked by its content or react to form a harmful content
- packaging and closure must in all parts be so durable that they cannot become loose and they must be sufficiently robust to withstand any normal handling
- packaging fitted with a multi-use closure should be designed in such a way that users can reclose the packaging several times without unwanted loss of its content.
- packaging must be sealed in such a way that it cannot be opened without damaging the seal.

It should be demonstrated that the applicable ADR [13] tests have been carried out or that the packaging has been certified by the UN and meets the transport classification of the product.

The FAO guidelines for packaging [14] can be obtained via the internet. The description of the packaging should clearly state when water-soluble packaging is used. CIPAC method MT 176 should be used for testing the suitability of water-soluble packaging.

More information is given in the “Recommendations for the Transport of Dangerous Goods” of the UN.

*Procedures for destruction or decontamination of the plant protection product and its packaging*  
(284/2013; 4.5)
4.5. Procedures for destruction or decontamination of the plant protection product and its packaging

Procedures for destruction and decontamination shall be developed for both small quantities (user level) and large quantities (warehouse level). The procedures shall be consistent with provisions in place relating to the disposal of waste and of toxic waste. The proposed means of disposal shall be without unacceptable influence on the environment and be the most cost effective and feasible.

Neutralisation procedures
(284/2103; 4.5.1)

4.5.1. Neutralisation procedures

Neutralisation procedures (such as by reaction with other substances to form less toxic compounds) for use in the event of accidental spillages shall be described, where such procedures can be applied. The products produced after neutralisation shall be practically or theoretically evaluated and reported.

Controlled incineration
(284/2103; 4.5.2.)

4.5.2. Controlled incineration

Chemical active substances as well as plant protection products containing them, contaminated materials, or contaminated packaging shall be disposed of through controlled incineration in a licensed incinerator in accordance with the criteria laid down in Directive 94/67/EC of the Council (1). If controlled incineration is not the preferred method of disposal, full information on the alternative method of safe disposal used shall be provided. Data shall be provided for such methods, to establish their effectiveness and safety.

More information about incineration of dangerous substances is given in Directive 2000/76/EC.

1.2.3. Supplementary data requirements

In addition to the requirements described in Commission Regulation (EU) No 283/2013 and Commission Regulation (EU) No 284/2013 of Regulation (EC) No 1107/2009, there are supplementary requirements arising from overlap with other European guidelines or from the Uniform Principles (2.7.2).

Aerosols

For aerosols, the supplementary requirements as described in Directive 75/324/EC [15] are also applicable.

“Free” content active substance

For capsule suspensions (CS) and encapsulated granules intended as slow release formulations the content free, unbound, active substance should according to FAO also be determined. Methods are still under development. Requirements have not yet been
laid down.

**Water-soluble packaging**
Where the formulation is used in water-soluble packaging, the relevant physical-chemical tests should be carried out with the water-soluble packaging because this may affect the physical properties.
The test must be carried out with the water-soluble packaging in the same ratio as for the use as proposed. The table of Appendix 4 shows which tests are required.

### 1.3. Assessment
An endpoint (such as, e.g., melting point, boiling point, vapour pressure etc) is derived from each study. These are presented in a list of endpoints (appendix 5).

The methods/guidelines from the table in Appendix 1 and 2 should be followed when performing the studies. Where a different method is used, a complete description of the method used should be provided, with a description of the differences in comparison with the required method. The reason for using a different method instead of the required method must be justified.

The following guidance documents are relevant for the evaluation:

### 1.4. Approval
This section describes the approval criteria for active substances (section 1.4.1) and plant protection products (section 1.4.2 and 1.4.3). For the EU approval procedure of active substances a representative formulation has to be included in the dossier. Therefore section 1.4.1 to 1.4.3 apply. For the zonal applications of plant protection products only section 1.4.2 and 1.4.3 apply.

#### 1.4.1. Approval of the active substance

Point 3 of Annex II of Regulation (EC) No 1107/2009 gives the criteria for the approval of an active substance. The texts specifically applicable to the aspect physical and chemical properties are presented below.

#### 3. Criteria for the approval of an active substance

3.4. Composition of the active substance, safener or synergist
3.4.1. The specification shall define the minimum degree of purity, the identity and maximum content of impurities and, where relevant, of isomers/diastereo-isomers and additives, and the content of impurities of toxicological, ecotoxicological or environmental concern within acceptable limits.
3.4.2. The specification shall be in compliance with the relevant Food and Agriculture
Organisation specification as appropriate, where such specification exists. However, where necessary for reasons of protection of human or animal health or the environment, stricter specifications may be adopted.

1.4.2. **Evaluation of plant protection products**

The principles for the evaluation (the Uniform Principles) regarding physical and chemical properties are presented in Commission Regulation (EU) No 546/2011 [17]. These concern the relevant sections of the introductory principles, the general principles and the specific principles Physical and chemical properties. The specific principles Physical and chemical properties are in the text below printed in a grey frame. This text, including numbering, is the literal text from Commission Regulation (EU) No 546/2011.

2.7 **Physical and chemical properties**

2.7.1. Member States shall evaluate the actual active substance content of the plant protection product and its stability during storage.

2.7.2. Member States shall evaluate the physical and chemical properties of the plant protection product and in particular:
- where a suitable FAO (Food and Agriculture Organisation of the United Nations) specification exists, the physical and chemical properties addressed in that specification,
- where no suitable FAO specification exists, all the relevant physical and chemical properties for the formulation as referred to in the "Manual on the development and use of FAO and WHO specifications for plant protection products".

This evaluation will take into consideration the following information:
(i) the data on the physical and chemical properties of the active substance as provided for in the Annex to Regulation (EU) No 544/2011 and the results of the evaluation thereof;
(ii) the data on the physical and chemical properties of the plant protection product as provided for in the Annex to Regulation (EU) No 545/2011.

2.7.3. Where proposed label claims include requirements or recommendations for use of the plant protection product with other plant protection products or adjuvants as a tank mix, the physical and chemical compatibility of the products in the mixture must be evaluated.

**Specific requirements of the technical characteristics of the product**

Appendix 2 of this document shows the requirements to be met for each physical-chemical property; these requirements have been taken from the FAO/WHO manual and other appropriate guidance.

There are no requirements for the physical and chemical substance properties. Only the determination of the properties themselves is subject to testing. The properties may, however, have an effect on labelling.

1.4.3. **Decision making of plant protection products**

The principles for the evaluation for decision making as regards physical and chemical properties are presented in Commission Regulation (EU) No 546/2011 [17]. These concern the relevant sections of the introductory principles, the general principles and the specific principles Physical and chemical properties. The specific principles Physical and chemical properties are in the text below printed in a grey frame. This text, including numbering, is the literal text from Commission Regulation.
2.7. **Physical and chemical properties**

2.7.1. Where an appropriate FAO specification exists, that specification must be met.

2.7.2. Where no appropriate FAO specification exists, the physical and chemical properties of the product must meet the following requirements

(a) **Chemical properties:**
Throughout the shelf-life period, the difference between the stated and the actual content of the active substance in the plant protection product must not exceed the following values:

<table>
<thead>
<tr>
<th>Declared content in g/kg or g/l at 20 °C</th>
<th>Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>up to 25</td>
<td>± 15% homogeneous formulation</td>
</tr>
<tr>
<td></td>
<td>± 25% non-homogeneous formulation</td>
</tr>
<tr>
<td>more than 25 up to 100</td>
<td>± 10%</td>
</tr>
<tr>
<td>more than 100 up to 250</td>
<td>± 6%</td>
</tr>
<tr>
<td>more than 250 up to 500</td>
<td>± 5%</td>
</tr>
<tr>
<td>more than 500</td>
<td>± 25 g/kg or ±25 g/l</td>
</tr>
</tbody>
</table>

b) **Physical properties:**
The plant protection product must fulfil the physical criteria (including storage stability) specified for the relevant formulation type in the ‘Manual on the development and use of FAO and WHO specifications for plant protection products’.

2.7.3. Where the proposed label claims include requirements or recommendations for use of the preparation with other plant protection products or adjuvants as a tank mix and/or where the proposed label includes indications on the compatibility of the preparation with other plant protection products as a tank mix, those products or adjuvants must be physically and chemically compatible in the tank mix.

**1.5. Developments**

The FAO is working on clarification of the term ‘relevant impurity’. A discussion would have to be held at European level about the manner in which to deal with the requirements for active substances (included in Commission Implementing Regulation (EU) No 540/2011) where these are used in a different form (such as salts, esters and/or hydrates).

**Classification and labelling**
Regulation (EC) 1272/2008 will influence the requirements for physical and chemical testing regarding classification in the future. From 1 June 2015, Directive 67/548/EEC and 1999/45/EC will be repealed.
2. APPENDICES

Appendix 1 Requirements regarding the active substance ........................................35
Appendix 2 Requirements concerning the product ......................................................40
Appendix 3 FAO 2-letter code for formulations .........................................................55
Appendix 4 Requirements per formulation type .........................................................63

### EU question | Description | Explanatory notes | Method / guideline | GLP
--- | --- | --- | --- | ---
283/2013 1.11 | Analytical profile of batches | Representative samples (at least 5 ‘batches’) of active substance must be analysed for their concentration pure active substance, inactive isomers, impurities and additives, where present. At least 98% of the analysed material must be accounted for. If an active substance is manufactured at different locations and/or by different companies, this information should be given separately per location or company. Where active substance samples from a laboratory environment or an experimental installation have been used for obtaining toxicological or ecotoxicological data, these samples must be analysed as well. | Yes

**283/2013 2.2** Melting point and boiling point | Measurements should be carried out up to 360 °C. | EEC method A1 Yes OECD 102 Yes Yes Yes

283/2013 2.2 | Vapour pressure, volatility, purified active substance | Where vapour pressure is lower than $10^{-5}$ Pa, vapour pressure at 20°C or 25°C may also be estimated from a vapour pressure curve. This parameter is used for evaluation of environmental behaviour and for the toxicological evaluation of the respiratory risk. | EEC method A4 Yes OECD 104 No

283/2013 2.3 | Description of colour and physical form of purified active substance as well as active substance as produced | Colour and physical form of purified active substance as well as active substance as produced must be described. | No

283/2013 2.4 | Spectra (UV/VIS, IR, NMR, MS), molar extinction at relevant wavelength, optical purity | The spectra (ultraviolet/visible light (UV/VIS), infrared (IR), nuclear magnetic resonance (NMR) and mass spectra (MS)) should be provided with a table with signal characteristics and with the molecular extinction at relevant wavelengths. For the UV/VIS spectrum, wavelength and molecular extinction should be given for each maximum above 290 nm. The UV spectrum must (if the active substance dissociates in water) be recorded at 3 pH conditions (acid, neutral and alkaline conditions). | For UV/VIS : Yes OECD 101

## EU question

### Description

Where a statement is submitted, this should either be based on the basis of decomposition energy (< 500 J/g by DSC analysis), the absence of functional groups or the oxygen balance, based on all components of the product.

This data requirement may also be waived if none of the components in the formulation is classified as explosive.

In order to classify based on Regulation (EC) 1272/2008, the EC test methods can no longer be used.

**Requirements:** none

### Explanatory notes

methods serving as basis for the statement are described in ‘Recommendations on the transport of dangerous goods’ (UN) p 398 (annex 6)

### Method / guideline

EEC method A17 (solids)

EEC method A21 (liquids)

The screening methods serving as basis for the statement are described in ‘Recommendations on the transport of dangerous goods’ (UN) p 401

### EU question Description Explanatory notes Method / guideline GLP

284/2013 Acidity/alkalinity and pH (for aqueous products) must be measured for acid (pH<4) of alkaline (pH>10) preparations The test gives indications regarding the stability of the active substance, of the physical properties, and possible corrosion of packaging. These parameters can also be used in the evaluation of toxicological (dermal) properties; certain dermal tests are not required for strong acid or alkaline solutions. Where the pH (pH of undiluted aqueous preparations or its 1% aqueous solution, see 2.4.2) of a preparation is acidic (pH<4) or alkaline (pH>10), acidity or alkalinity, respectively, must be determined (MT 191, which replaced MT31). Acidity or alkalinity must be expressed in free H₂SO₄ or NaOH. For aqueous preparations, pH should always be determined for the undiluted product (MT 75.3).

Requirements: none. CIPAC MT 31 Yes

CIPAC MT 75.3

CIPAC MT 191

284/2013 pH 1% solution in water The test gives indications regarding the stability of the active substance, of the physical properties, and possible corrosion of packaging. This value can also be used in the evaluation of toxicological (dermal) properties. CIPAC MT 75.3 Yes

CIPAC MT 75.3
### EU question Description

<table>
<thead>
<tr>
<th>EU question</th>
<th>Description</th>
<th>Explanatory notes</th>
<th>Method / guideline</th>
<th>GLP</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>properties; certain dermal tests are not required for strong acid or alkaline solutions. Required for all preparations used as aqueous solution. For formulations which are aqueous, a pH determination of the undiluted product is required (see 545/2011 2.4.1). Requirements: none.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>284/2013</td>
<td>Kinematic viscosity</td>
<td>Where of ULV (ultra low volume) applications, kinematic viscosity must be determined. Viscosity should be determined at 40°C and optionally at other temperatures. This parameter is used to evaluate whether the product is to be classified an aspiration hazard (assignment risk phrase R65 or H304). Requirements: kinematic viscosity must be reported at 40 °C in m²/s.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>284/213</td>
<td>Viscosity of non-Newtonian liquids</td>
<td>For liquids with a non-Newtonian behaviour (i.e., viscosity depends on the applied force/shear rate), viscosity must be determined according to OECD 114 by using a rotation viscometer. Viscosity should be determined at at least 40°C if the hydrocarbon concentration is higher than 10%, and the dependence on shear rate should be reported at at least 2 shear rates. This parameter is, together with surface tension, used to evaluate the risk in case of swallowing of the preparation (assignment risk phrase R65). Note: if a dynamic viscosity determination should be recalculated to a kinematic viscosity, data on the density at 40°C may be required if the viscosity is close to a trigger value for classification (i.e. 7mm²/s or 20.5mm²/s). Requirements: dynamic viscosity must be reported in Pa.s at 40 °C, kinematic viscosity must be reported in m²/s. In case viscosity is dependent on shear stress, dependency must be reported (2 or more shear rates must be reported, covering the range 20 to 100s⁻¹).</td>
<td>OECD 114, only rotational viscometer permitted CIPAC MT 192</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Surface tension of liquid preparations

- **Description**: Surface tension must be determined of the undiluted formulation at 25 °C. This parameter is together with viscosity used to evaluate whether the product is an aspiration hazard (assignment risk phrase R65).

- **Method / guideline**:
  - EEC method A5
  - OECD 115

- **Note**: For classification according to Regulation (EC) 1272/2008, the surface tension is not used to determine whether the product is an aspiration hazard.

- **Requirements**: reported in N/m at 25 °C

### Relative density of liquid preparations

- **Description**: Gives information for packaging, transport and application. (Remark: Relative density has no units)

- **Method / guideline**:
  - EEC method A3
  - OECD 109
  - CIPAC MT 3

- **Requirements**: method and temperature at which the determination was performed must be reported.

### Effective (bulk) density solid preparations

- **Description**: Gives information for packaging, transport and application. The method to be applied depends on the type of formulation:
  - powders: MT 33 (tap density)
  - granules: MT 159
  - water-dispersible granule (WG): MT 169 (tap density)
  - all solid formulations: MT 186 (revised method of MT33, MT58.3, MT 159 and MT 169, preferred method)

- **Method / guideline**:
  - CIPAC MT 33, CIPAC MT 159, CIPAC MT 169, CIPAC MT 186

- **Requirements**: none

</tbody>
</table>
Appendix 4 Requirements per formulation type

The requirements (X) per formulation type as regards the technical characteristics of the plant protection product are given in the table below. Studies to be carried out after the storage tests are indicated as well (S).

Abbreviations of the formulation types are given in Appendix 3.

The following tests (all formulation types) must be carried out after the storage tests as well. These are, however, not included in the table below:
- analysis of relevant by-products –if any- and if applicable the by-products that are not water soluble
- acidity/alkalinity or pH

Glossary:
Dispersion/Suspension = fine distribution of a solid in a liquid
Emulsion = fine distribution of a liquid in a different liquid (e.g., oil in water)

1) If the preparation is packed in a water-soluble packaging this test should be carried out with the addition of the water-soluble packaging in the same ratio as the product will be used (for foam formation this test should in case of a water-soluble packaging also be carried out after the storage tests)

2) Only required if the product is diluted with water before use

3) Only required after storage test if physical characteristics of the product have changed

4) Only required if the preparation is used as emulsion

5) Only for FT formulations

6) Methods for these technical characteristics are not yet available

| X= requirement |
| XS= requirement, before and after storage |
### APPENDIX 5 LIST OF END POINTS (EPCO MANUAL E4 – REV. 4 (SEPTEMBER 2005))

**Chapter 2.1 Identity, Physical and Chemical Properties, Details of Uses, Further Information**

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Function (e.g. fungicide)</td>
<td></td>
</tr>
<tr>
<td>Rapporteur Member State</td>
<td>e.g. The Netherlands</td>
</tr>
<tr>
<td>Co-rapporteur Member State</td>
<td></td>
</tr>
</tbody>
</table>

#### Identity (Annex IIA, point 1)

- Chemical name (IUPAC)
- Chemical name (CA)
- CIPAC No
- CAS No
- EC No (EINECS or ELINCS)
- FAO Specification (including year of publication)
- Minimum purity of the active substance as manufactured
- Identity of relevant impurities (of toxicological, environmental and/or other significance) in the active substance as manufactured
- Molecular formula
- Molecular mass
- Structural formula

#### Physical-chemical properties (283/2013, point 2)

- Melting point (state purity)
- Boiling point (state purity)
- Temperature of decomposition
- Appearance (state purity)
- Vapour pressure (state temperature, state purity)
- Henry's law constant
- Solubility in water (state temperature, state purity and pH)
- Solubility in organic solvents (state temperature, state purity)
- Surface tension (state concentration and temperature, state purity)
- Partition coefficient (state temperature, pH and...
purity
Dissociation constant (state purity)
UV / VIS absorption (max.) incl. $\varepsilon$ (state purity, pH)
Flammability (state purity)
Explosive properties (state purity)
Oxidising properties (state purity)

**Classification and proposed labelling** (283/2013, point 10)
with regard to physical and chemical data
